

Already Has a Disability
 But Still Facing the
 Cruelty of reality. Blindness: A Cruel
 Disability

Imagine if you couldn't see properly and the treatment
 or help you need still requires money. Unfortunately this is
 not fictional.
 Around

Same?

2.2 billion people worldwide have ~~unfortunately~~ lost their
 ability to see properly. Many people would say the answer
 is eye care. What they don't realize is that not all people
 that have vision impairment can afford eye care.

But it's not completely wrong, most people just fix it with
 glasses, low cost surgery, and seeing the doctor regularly. The
 problem isn't the idea, it's the way it is distributed.

The most vulnerable to this disability are women, the elderly
 and more. Which is sad considering these people cannot see anything
 properly and most of them live like this even in their final
 days on earth.

There are many different ways why people get vision impairment
 or blindness. They can lose their vision from radiation, damage
 of the iris and pupil, extremely bright light, bacteria, and
 the worst way, being born with it.

But there is still hope.

There is a new treatment regarding using a high powered
 and precise laser to refocus the iris and pupil, enabling sight
 and disabling blindness. Let us make our environment beautiful so that

when they look they will see the beautiful world once more.

The Obstacle in life

*Thyrae
hyle.*

2nd

There are more and more reports of vision loss around the world. Around 2.2 billion people are blind almost a third of the world's population and there are around 8 billion people on the world so that's a lot of people.

Blindness can cause serious harm because of accidents, murder and getting prank by other people. Blindness and vision loss is caused by too much of using gadget's and aging.

The simple treatment is buying glasses or need low-cost surgery and see a doctor regularly. They need to get a treatment because it will get worse and worse.

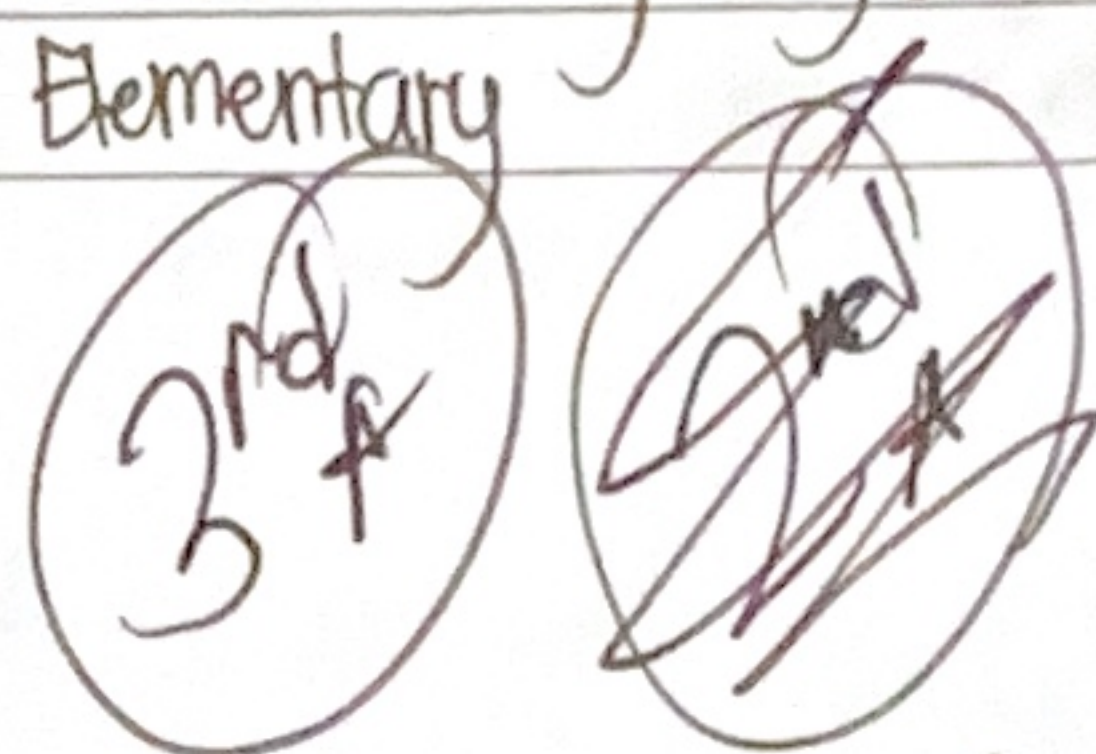

But blind people have a advantage because if you lose 1 sense the other sense's will be alerted more than the people that has perfect vision.

Blindness or vision loss is a common thing to happen when you are old but if you have vision loss as a kid or teenager cause it mean's you're always using gadget's or a normal thing to happen because we all don't have the same health care.

If you want this to be less dangerous always carry a blind stick to all blind people and wear glasses if you have vision loss. blind people can ask for a friend or a family member to help them.

To most people it seemed hard to be blind but if you get use to it it will be easy and not hard anymore and some people make fun of them there blind

The spreading population.
 The spreading problem that many humans occurred

Many human beings suffered from more injuries that affect from their body. Other mentioned to see the doctor and go to an another hospital that helps them heal faster. This kind of illness takes the whole internet and known from many countries like Philippines. The problem of eye vision, from many humans on earth this kind of disease was applied on elders. They suffered to see clearly and cannot see the world of people they know. From many people on earth many were affected by the issue of seeing properly or eye vision.

Today atleast 2.2 billion of human were suffering from the eye disease caused by population on earth. Many came on hospitals to heal but failed to heal their eye. Eye care now was familiar from many places on earth.

This disease was first caused by population from many people on earth throwing trash irregularly on roads. This cause to make people sick and blind because of polluted air and some chemical entered to the eye. Population can grow faster when more people throw trash to lakes and ocean or even roads.

To fix the disease the important part is to see the doctor so it can examine the lens and inform it to the person. Wearing glasses also makes the eye contact see properly. It can also help by low cost surgery for the eye vision disease.

This disease can possibly affects elderly women or men when they grew older. People with disabilities were affected and suffered from seeing properly. Indigenous people also were struggling to see and know which item were they holding with.

But know billion of people who came to an hospital that they know can fix the disease were lining to the doctor. For many years past eye care was not available from plenty hospitals on earth. Because of maximum humans lining to the hospital finding for the cure.

All countries on earth may have this disease, not a spreading disease but a disease that was caused by human action. Like a thing that exist called greenhouse gas where people believed that pollute the only place on earth. This was caused on many factories on earth, the steaming gas that blows out when a special accessories or item were made.

This disease still continues to affect many people on earth. Not by it symptoms but by the persons actions. While the disease continues doctors continues to plan something so the person will heal.

People across the country will not only affected by the disease if humans wouldn't do something to pollute the environment. By avoiding doing dangerous things your eyes will be safe and undamaged. By polluted air debris we should avoid harming our body and doing dangerous actions. People wanted to see their love once clearly without eyes we can't see them anymore but their voice; we should be grateful to have a eye and body we can't see the world and our love once when we have no eyes.

Unseen Lives
 How blindness affects our daily lives

Behind the young hearts of a lot of people, blindness is not only a common sickness. It is a thing that goes on and on through peoples lives. Our two eyes is not just an ordinary thing, but it is rather the most significant part of our body. Losing vision is like a dark cloud that covers a bright day, for now you might see most of the time, but we don't know, one day you'll lose vision for the rest of your life when not cured.

From the flashing news delivered by the International Agency on the Prevention of Blindness (IAPB), today at least 2.2 billion of people have a vision impairment or blindness. This number of people is nearly a third of the world's population, which is a terrifying case because up to this day, a ton of people are experiencing it.

As a matter of fact, most just need glasses, some need low-cost surgery, and others need to see a doctor regularly. This is actually very devastating for a lot of people because many people can't afford most of the treatments because of how expensive it is.

Eye care is hard to get because it is out of reach for at least a billion people because it is unfairly distributed. Governments need to always integrate eye care into health services, because a lot of people can't afford it.

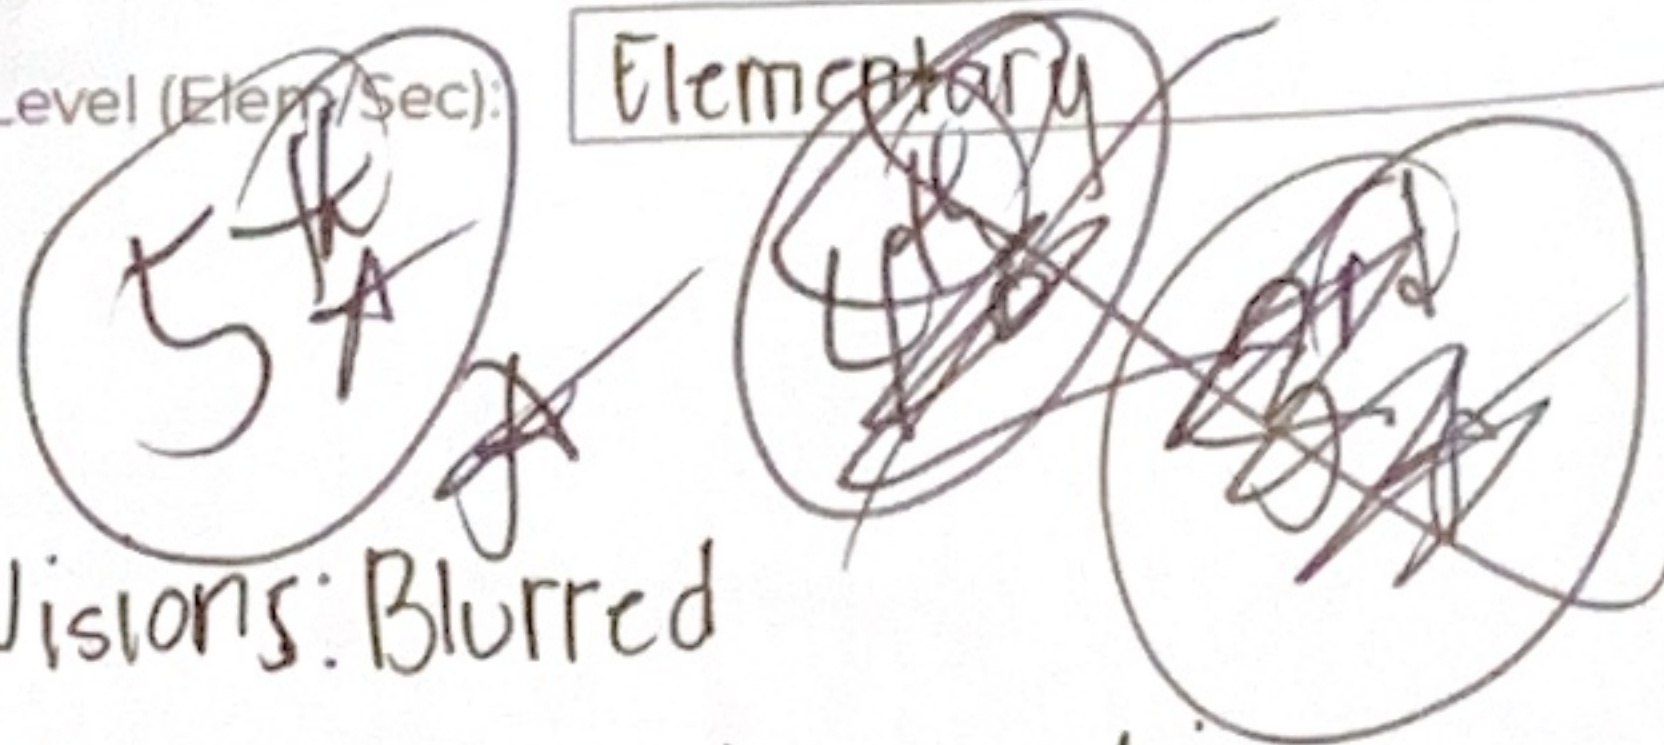

Vision impairment is very common to the elderly because of their aging, but we still need to take action to cure it before it gets too late.

Our eyes is the most vulnerable things in our daily lives. Having a clear vision ~~is~~ helps us be more aware of our surroundings, know what we are eating or touching, and be more careful.

Tons of humans are experiencing blindness because of radiation, inborn, or because how old they are. Together, let's allow using phones a little less to protect our eyes and reject blindness spreading because of it. We should try to prevent this issue for a better and healthy lives.

#30

Shorter title pls.

Two Eyes Two Visions: Blurred
 Eyesight is like different world without an Iris

Blindness is a disability that can be hard
 to see anything without any circumstances.

The International Agency on the Prevention of
 Blindness (IAPB) ^{poor for the} are in verge of a problem is
 spreading worldwide. People that are blind or people
 who are struggling to see anything are causing their
 families to pay for their medical bills, costing their life.

Today, there were estimated of 2.2 billion people
 that has vision impairment or being blind, which is nearly
 30% of the world's population. This is were the agency's
 main problem as its enormous population are hard to cure
 for each person.

Yet, the cure is supposed to help blind people around
 the world, but with its many people, they couldn't do it alone.
 Blurred eyesight can also require surgery, but the price
 itself could not hold back. As its spreading worldwide, babies
 who are born with grey looking eyes withan' obvious white
 center on the iris, it can affects their lives through bullying
 and social anxiety.

There's also some cases of colorblind people, they can struggle what they see except they're not blurred but color. They can see but they can't guess what color did they see. They're also some reported cases of people seeing only black and white which is a rare condition, they're like seeing the 1900s again.

The affected ones are mostly the elderly, women, PWD, minors, and indigenous people, as it's common mostly for them. They usually wear glasses if their vision is blurred, others need low-cost surgery because usually at hospitals are the most expensive, exceeding to 10,000 \$, which in pesos are nearly 50,000 ₱.

Others regularly see a doctor for a checkup routine. As it's helpful for the blind community, but some who are really affected through causes like volcanic ash, onions, and burns.

To prevent this - stay away from hazardous areas like a volcano that is nearly erupting, stop putting onions to your eyes as it can cause irritation and redness. Our eyes are important because they are delicate and have their own immune system as we can see everything and the world.
